L0-L2: Actual TLE

L3-L4: Reference column number

## Line 0

Column 1-24

## Common Name

Common name for the object based on information from the Satellite Catalog

### Line 1

Column 1

## Line Number 1

## Column 3-7

NORAD Catalogue Number

5 digit satellite identification number used since first satellite was launched in 1957

Sometime referred to as NASA #, SCC #, or SSC #

## Column 8

## Satellite Classification Designation

U - Unclassified

C - Classified

S - Secret

Column 10-17

## International Designator

Coded to inform reader of the year and order of the launch within the year

Ex: 98067A

98 - launch year of 1998

067 - 67th launch in year 1998

A - primary payload

This subsequent lettering indicates secondary payloads and rockets that were directly involved in the launch process. Debris detected from the original object is catalogued as a subsequent letter (B, C, D, etc.) in order of when they were detected. Some satellites have broken up into hundreds and even thousands of pieces, each having its own International designator number. Debris can exceed the 26 letter alphabet, and so two (or more) letters can be used (AA, AB, AC, etc.).

## Column 19-32

### Epoch

UTC time when the TLE's indicated orbit elements were true

Columnn 19-20 - epoch year, ("57"- "99" = 1957 to 1999 and "00"- "56" = 2000 to 2056)

Column 21-23 - epoch's integer day (001 to 365, or 001 to 366 in a leap year)

Column 24-32 - decimal (fraction) days

Ex: 06052.34767361

06 - 2006

052 - February 21

.34767361 - 08:20:39 U.T.C.

## Column 34-43

### Mean Motion Dot $\dot{n}$

Half of the first time derivative of the Mean Motion

Measured in (orbits/day<sup>2</sup>)

Defines how the Mean Motion changes from day to day so that some orbit propagation software can continue to predict the location of the satellite accurately over longer periods of time from the TLE Epoch. This value can be negative or positive. Not all orbit propagators read or use this value.

## Column 45-52

### Mean Motion Double Dot $\ddot{n}$

One sixth the second time derivative of the Mean Motion

Measured in (orbits/day<sup>3</sup>)

Defines the rate of change of the Mean Motion Dot from day to day so that some orbit propagation software can continue to predict the location of the satellite accurately.

The Mean Motion Double Dot is normally zero unless the satellite is being maneuvered or is undergoing orbit decay.

Ex:  $-12345-6 = -0.12345 \times 10^{-6}$  Not from ISS example above

## Column 54-61

### B-Star Drag Term $B^*$

Used for SGP4 type propagator and estimates effects of atmospheric drag on satellite's motion

Measured in units of (EarthRadii<sup>-1</sup>)

Ex:  $97127-4 = +0.97127 \times 10^{-4}$  EarthRadii<sup>-1</sup>

$$B^* = \frac{\rho_0 C_D A}{2m}$$

$B^*$  = B-star drag term

$\rho_0$  = atmospheric density

$C_D$  = drag coefficient

$A$  = cross-sectional area of satellite

$m$  = mass of satellite

[illegible]

## Line 2

## Column 1

### Line number 2

## Column 3-7

NORAD catalogue number

## Column 9-16

## Inclination $i$

Measured in degrees

Angle of satellite's orbit plane measured from Earth's equatorial plane

Inclination between 0 to 90 deg is called prograde orbit (satellite orbits around Earth in same direction as Earth's rotation)

Inclination between 90 and 180 is called a retrograde orbit (satellite orbits around Earth in opposite direction as Earth's rotation)

Ex: 051.6421 - 51.6421 degrees above Earth's equatorial plane

## Column 18-25

### Right Ascension of Ascending Node (RAAN)

Measured in degrees

Geocentric Right Ascension of a satellite as it intersects the Earth's equatorial plane traveling northward (ascending)

## Ranges between 0 to 360 degrees

Ex: 063.2734 - 63.2734 degrees from the First Point of Aries at the specified Epoch in the TLE

Column 27-33

### Eccentricity $e$

Unitless

Ratio of the satellite orbit's focus distance to the orbit's semi-major axis

Defines how elliptical the orbit is

Ranges between 0 (perfectly circular orbit) to 1 (parabolic orbit)

Ex: 0007415 - 0.0007415

$e = 0$  (circle)  
 $e < 1$  (ellipse)  
 $e = 1$  (parabola)  
 $e > 1$  (hyperbola)

## Column 35-42

## Argument of Perigee $\omega$

Measured in degrees

Defined as the angle within the satellite orbit plane that is measured from the Ascending Node to the perigee point along the satellite's direction of travel

### Ranges between 0 to 360 degrees

Ex: 308.6263 - 308.6263 degrees from the satellite orbit's Ascending Node to its perigee point
